

Blending 2

Problem

- Find the optimal purchase and production policy.

Sets

- Oils: $o = 1(V1), 2(V2), 3(N1), 4(N2), 5(N3)$.
- Months: $m = 1(jan), \dots, 6(jun)$

Parameters

- Sales price of final product: $SellPrice$.
- Purchase price of oil o in month m :
 $PurchaseCost_{m,o}$
- Hardness of oil o : $Hardness_o$
- Lower hardness: $LowerHardness$
- Upper hardness: $UpperHardness$
- Refinery capacity of V oil: $RefCapVeg$
- Refinery capacity of NV oil: $RefCapNonVeg$
- Initial storage of each oil: $InitialStorage$
- Final storage of each oil: $FinalStorage$
- Storage cost: $StorageCost$
- Storage capacity: $StorageCap$

Decision variables

- Amount of oil o bought in month m : $x_{m,o}$
- Amount of oil o used in month m : $y_{m,o}$
- Ultimo stock of oil o in month m : $s_{m,o}$ (IMPORTANT)

Model

Objective:

- Objective is profit to be maximized:

$$\begin{aligned} & SellPrice \sum_m \sum_o y_{m,o} \\ & - \sum_m \sum_o PurchaseCost_{m,o} \cdot x_{m,o} \\ & - \sum_m \sum_o StorageCost * s_{m,o} \end{aligned}$$

Constraints:

- Lower hardness:

$$\sum_o Hardness_o \cdot y_{m,o} \geq LowerHardness \sum_o y_{m,o}, \forall m$$

- Upper hardness:

$$\sum_o Hardness_o \cdot y_{m,o} \leq UpperHardness \sum_o y_{m,o}, \forall m$$

- VO refinery capacity:

$$\sum_{o=1}^2 y_{m,o} \leq RefCapVeg, \forall m$$

- NO refinery capacity:

$$\sum_{o=3}^5 y_{m,o} \leq RefCapNonVeg, \forall m$$

- Storage capacity:

$$s_{m,o} \leq StorageCap, \forall m, o$$

- Final storage:

$$s_{o,6} = FinalStore, \forall o$$

- Positive buying, use and storage:

$$x_{m,o}, y_{m,o}, s_{m,o} \geq 0, \forall m, o$$

- Material balance(1), ultimo storage, using two constraints:

$$s_{m-1,o} + x_{m,o} = s_{m,o} + y_{m,o}, \forall m > 1, o$$

- Material balance first period:

$$InitialStore + x_{1,o} = s_{1,o} + y_{1,o}, \forall o$$

- Material balance(2), ultimo storage, using just one constraint, but with conditional parts:

$$\begin{aligned} s_{m-1,o}|(m > 1) + InitialStore|(m = 1) \\ = \\ s_{m,o} + x_{m,o}, \forall m, o \end{aligned}$$

- Material balance(3), Primo storage:

- Initial condition:

$$s_{m,o} = InitialStore, \forall m = 1, o$$

- Balance:

$$s_{m+1,o} = s_{m,o} + x_{m,o} - y_{m,o}, \forall m < 6, o$$

- End condition:

$$FinalStore = s_{m,o} + x_{m,o} - y_{m,o}, \forall m = 6, o$$

The full model in Julia/JuMP, available with the name

`Blending2.jl`

from the book web-site, is given below:
